The present invention relates to switching power supplies, and more particularly to an improved switching power supply of the forward/flyback type adapted to quickly and effectively respond to load variations in, for example, a fluorescent lamp ballast. The forward/flyback type switching power supply (sometimes referred to as a "flyback" type) is well known. This type of switching power supply includes a primary winding and a secondary winding which are respectively connected across a power source, such as a D.C. source, and a secondary winding or output winding (of a transformer) to provide a first output voltage. A switch is connected in series with the primary winding to periodically block the flow of current therethrough to produce a second output voltage. The second output voltage is rectified and filtered, using a low-pass filter or similar circuit means, to produce a rectified, filtered, and/or filtered and stabilized output. A flyback switching power supply of this type is connected in a current-limiting or "soft start" mode in the presence of a light load condition at the primary side, such as a fluorescent lamp ballast. In this mode, the flyback switching power supply remains connected to the D.C. power source to provide the first output voltage. During the operation of a ballast in this mode, the fluorescein tube (sodium lamp) is turned on by a simple switching action to illuminate the lamp. However, since the current supplied to the ballast is relatively low, the electron-beam tube (sodium lamp) continues to dim from its initial "cut-in" level, without appearing as bright as expected. An example of this type of prior art inverter is described in U.S. Pat. No. 5,268,939. Alternatively, when the inverter is operating in the "forward" mode, the inverter provides an "on" signal to the flyback switching power supply to trigger the secondary winding to produce the 04aeff104c
