Overall, FinePix HS20 uses a good camera in an easily handled (for me, anyway) too-large camera. The results are functional and they're sufficient for Web work (which is what I mostly do, for now), but this camera doesn't nail the image quality of the 5- to 6-MP shots I get from a pocketable camera like, say, the Canon SX210 IS. In outdoor use, it doesn't do much of a difference, either. Personally speaking, I needed FinePix HS20 for the features it offers: the simple ability to take decent shots from just about anywhere at any time—something that's nearly impossible to find in any camera except for the tiny high-end point-and-shoot models. I was really impressed with the Aperture 3 source code for iOS. I believe that they should have given iOS and iOS Simulator apps even more attention. During installation, it is not even possible to count on the overall speed of most APIs to function as intended. I really appreciate how the RAW file selection / photo management functionality of CS6 continues to evolve. What used to be a basic file manager with basic file management functionality has now become an even more intuitive and temporarily pleasant location manager with excellent support for additional image editing tools. The Quick Selection tool is a great addition to the selection tools, too. You can now select a complex selection using the Quick selection tool and then create a selection from it that is used to select/crop an area. I am not sure that people are aware of this yet, but the Quick Selection tool can be used for this. This feature allows you to create more complex selections by selecting areas from multiple images at once. The ability to merge selections on files saved as **sds** is also useful, either automatically or manually on existing files, respectively. Copying and pasting files is also simplified. And if you simply drag data from the OS file manager, it is automatically copied over and as expected. The Import function is also much improved as well.
